TAR 2022 Lab 3

In order to be able to solve the assignment, please install `jupyter` if you don't have it already.
We advise you to install `conda` to manage your environment. You can install `jupyter` via `conda` or `pip` if you decide to use it for package management.

Create a new environment (e.g., `tarlab3`) with python 3.9 and activate the newly created environment.

```
conda create --name tarlab3 python=3.9
conda activate tarlab3
```

You can install `jupyter` directly in the activated environment with:

```
conda install jupyter
```

It is important that your jupyter notebook is linked to the correct environment (`tarlab3`). We advise you to run `jupyter` once you've activated the environment.

You need to install several packages with `pip` or `conda` :

```
numpy
transformers==4.19.2
sentencepiece==0.1.96
```

Submission deadline: **May 29, 2022, 23:59 CET**
